(1) What is Field of View?

Field of View is similar to a flashlight. The further object is away, the bigger the diameter of the beam. The further you are from a sample, the larger the area the IR thermometer is measuring. For example: if the Field of View ratio for a thermometer is 6:1, then, when the thermometer is 15.2 cm from an object the sensor is looking at and measuring a 2.5 cm diameter. If the thermometer is 3.1 cm away, then the spot size being measured is 0.6 cm.

(2) What is Emissivity?

Emissivity refers to the amount of infrared radiation an object emits. The emissivity adjustment on IR thermometers is used to compensate for different materials. The default emissivity of 0.95 covers 90% of typical applications. For thermometers with adjustable emissivity a materials chart with suggested settings is provided. Generally very shiny, highly reflective surfaces require low emissivity settings.

Stopwatch Timing Features

- A Single Action Timing:** Pressing start key begins timing, a second press stops clock.

- B Time-out/Time-in:** Records total elapsed time with any number of "time-outs". Permits stopping timer for "off" periods, holds reading where stopped, and starts again from that point.

- C Continuous Timing:** Digits offer a continuous display. When maximum display is reached, digits rollover to zero and automatically begin timing again. Permits timing for hours, days, or weeks.

- D Cumulative Split:** Freezes display for partial event times while internal clock continues to run and measure total elapsed time since starting timer.

- E Interval Split:** Yields a readout of each individual time increment of a connected series of events. Each press of key displays time interval since previous press.

- F Memories:** Capture and store up to six or eight separate times and display them while timing or after event is over. Never look away from a lab test even to take notes.

- G Countdown I (repeat):** An alarm sounds at zero, program automatically repeats, counts down, and alarms again. It continues this sequence until stopped.

- H Countdown II:** Allows setting unit to countdown. An alarm sounds at zero.

- I Sample Counter:** Box on display shows sample number for each split taken.

Traceable® Certificate

To assure accuracy an individually-numbered Traceable® Certificate which assures accuracy from our ISO/IEC 17025:2005 (1750.01) calibration laboratory accredited by A2LA. It indicates traceability of measurements to the SI units through NIST or other recognized national measurement institutes (NMI) that are signatories to the CIPM Mutual Recognition Agreement.

“If you can’t measure it accurately, you can’t manage it efficiently...”

What is Traceable®?

Traceable® means that a unit is individually serialized, calibrated, and certified with an unbroken chain of traceability to the NIST.

In the context of measurement science, traceability is the result of a measurement can be traced back to a national authority such as the National Institute of Standards and Technology (NIST), a United States Government Agency within the Commerce Department.

Why Traceable®?

For a critically controlled and certified process, make sure that you are using calibrated instruments. Traceable® units come with a unique and individually serialized certificate that shows all of the information needed for validation. You can be confident in the readings that you are getting and our units are always cost effective.
